

**LONG TERM PAVEMENT PERFORMANCE  
PROGRAM DIRECTIVE**

For The Technical Direction Of The LTPP Program

**Program Area: Monitoring  
AWS-5**

**Directive Number:**

**Date: November 18, 1996**

**Supersedes: AWSCheck v1.0**

**Subject: Upgrade of AWSCheck Software to Version 1.1**

---

This new version of the AWSCheck software contains modifications made in response to feedback from the RCOs. More specifically, the following modifications were made in this program version:

- Added a function that allows the user to specify data to be included in the IMS upload file.
- Added a function that allows the user to delete the uploaded portion of the EDT file.
- Added a function that allows the user to view the upload log file.

These new functions and their usage are described in more detail in the accompanying documentation -- i.e., Users Guide.

AWSCheck v1.1 should be installed on all computers being used to enter and process AWS data. Installation consists of copying the file AWSINSTL.EXE off the distribution diskette and into the AWSCheck directory. Once done, run the AWSINSTL.EXE program and answer "yes" to overwrite existing program files. If this procedure is followed, the AWSCheck program should be able to read and process all data previously entered and processed with version 1.0 of the AWSCheck program.

NOTE:

**AWSCheck v1.1 is fully compatible with v1.0 and does not require any reprocessing or re-creation of upload files created with v1.0. If data have not been processed, it is recommended that you use AWSCheck v1.1; however, please note that there are no differences in the upload file generated by either version.**

As always, if there are any questions concerning these modifications or any comments on the AWSCheck program, please do not hesitate to call or submit a problem report form (AWSPR).
